
Colour stabilisation of wood surfaces

Taking different wood species into consideration, treatments and coatings for wood and veneered wood-based panels are to be developed which minimize colour changes as a result of environmental factors. Methods are to be developed which will indicate potential negative effects prior to processing. Such negative effects may then be counteracted using the methods under development. Information on the methods resulting from these investigations will be made available to wood processors as a technical datasheet or brochure.

Title of project: Colour stabilisation of wood surfaces

Support Program/Supported by/Sponsored by: FFG

Duration: 2008– 2011

Responsible for project/Project Leader/Contact: Mr. Andreas Illy (a.illy@holzforschung.at)
