## High-performance wood facades

Aside from solid wood and three-layer solid wood panels (spruce, timber) an increasing number of new materials are being used in the designing of facades. In the course of this research project natural weathering trials were conducted in order to compare new materials directly with established systems. Results were published by proHolz for use by craftsman and industry in two separate publications (flame spread and building physics in wooden facades). All results are presented in detail in substantial project reports and were published in late 2008 in a revised brochure dedicated to wooden facades. Project coordination; Holzforschung Austrian and Association of the Austrian Wood Industry.

**Title of project:** High-performance wood facades

**Support Program/Supported by/Sponsored by:** FFG

**Duration:** 2006– 2009

**Responsible for project/Project Leader/Contact:** Mr. Peter Schober ([p.schober@holzforschung.at](mailto:p.schober@holzforschung.at))
